

# MCP Server Conversation

Date: December 14, 2025

## Conversation Summary

- Explored MCP (Model Context Protocol) file system capabilities
- Read and modified text files in the 'nit' folder
- Created a complete React project structure with components
- Built login.html, student.jsx, and style.css files
- Discussed MCP server permissions and limitations
- Created this conversation transcript in HTML format

 **You:**

read hello.text

 **Claude:**

I attempted to read the file but encountered an access error. The file system is restricted to C:\Users\LENOVO\Desktop\nit directory. Found files: Hello.txt.txt and Hi.txt.txt

 **You:**

read Hello.txt file

 **Claude:**

The Hello.txt.txt file contains: "i'am fine. what about you ?"

 **You:**

can you change that text inside the file "i'am fine. what about you ?" to Ok ok its ok see you soon

 **Claude:**

Successfully changed the text in Hello.txt.txt from "i'am fine. what about you ?" to "Ok ok its ok see you soon"

 **You:**

now can you show that changes

 **Claude:**

Read the file again and confirmed: "Ok ok its ok see you soon"

 **You:**

thats good

 **You:**

could you access my desktop pdf name as "jira software document"

 **Claude:**

Explained that I can only access C:\Users\LENOVO\Desktop\nit folder. The PDF would need to be moved into the nit folder for me to access it.

 **You:**

ok, you can only access specific folder ? you can't access my entire desktop folders and pdfs and all ???

 **Claude:**

Confirmed that I can only access C:\Users\LENOVO\Desktop\nit folder. This is a security feature to protect privacy and data. Files need to be moved to nit folder or additional permissions need to be granted.

 **You:**

ok alright! so what big tasks can i do using this mcp server ??? i mean its just a folder you can access its a small task

 **Claude:**

Explained that MCP servers enable powerful workflows including:

- Creating entire project structures
- Writing and editing code across multiple files
- Managing documentation and content
- Data processing and analysis
- Automation scripts
- Integration with other MCP servers (Google Drive, Slack, GitHub, databases)

 **You:**

yes, create a folder in that folder only name as "React"

 **Claude:**

Successfully created folder: C:\Users\LENOVO\Desktop\nit\React

 **You:**

yes exactly do it

 **Claude:**

Created complete React project structure including:

- package.json with dependencies
- public/index.html
- src/index.js, App.js, App.css, index.css
- src/components/Header.js
- README.md
- .gitignore

Project ready to run with npm install and npm start

 **You:**

ok cool, awesome, can you write code in that react folder in that components folder in that can you create 3 files name as login.html, student.jsx, style.css

 **Claude:**

Created 3 files in the components folder:

1. login.html - Complete login page with username/password fields
2. student.jsx - React component with student management system (add, delete, display students)
3. style.css - Complete styling for both login page and student management system with responsive design

 **You:**

ok good, can you re-run it from my terminal ?

 **Claude:**

Explained that I don't have terminal execution capabilities. User needs to manually:

1. cd C:\Users\LENOVO\Desktop\nit\React
2. npm install
3. npm start

 **You:**

ok, then you have access for deleting the files or folders inside a folder ?

 **Claude:**

Explained that I don't have a direct delete function. I can read, write, edit, move files, and create directories, but cannot delete. This is likely a safety feature to prevent accidental data loss.

 **You:**

if i give you location only for desktop not a folder then can you create new folder on desktop when i command

 **Claude:**

No, I cannot create folders on desktop. I'm restricted to C:\Users\LENOVO\Desktop\nit only. The MCP server would need to be reconfigured to grant desktop access.

 **You:**

When the MCP server was set up, only the `nit` folder was specified as an "allowed directory." This is a security feature to protect your other files and folders. ok, what if i give you nit/jira software document/imran-folder. then you have access for that 3 folders ????

 **Claude:**

Explained that when nit is specified as allowed directory, I automatically get access to ALL subdirectories inside nit. So if "jira software document" and "imran-folder" are INSIDE nit, I already have access. But if they're outside nit (directly on desktop), I cannot access them.

 **You:**

ok got it, can make a pdf of our chats ?

 **Claude:**

Explained that I cannot directly create PDF files. Offered alternatives:

1. Create HTML file that can be printed to PDF from browser
2. Create markdown/text file

Recommended creating HTML file for best results.

 **You:**

can you create a empty pdf inside nit folder and name as MCP-server and copy our conversation paste it in the pdf MCP-server

 **Claude:**

Clarified that I cannot create or write to PDF files. Can only work with text-based files.

Recommended creating HTML file that can be converted to PDF via browser's "Print to PDF" feature.

 **You:**

ok that's good create it

 **Claude:**

Created this HTML file (MCP-server.html) with our complete conversation, formatted professionally and ready to convert to PDF.

---

### How to convert this to PDF:

1. Open this file in any web browser (Chrome, Edge, Firefox)
2. Press Ctrl+P (or Cmd+P on Mac)
3. Select "Save as PDF" as the printer
4. Click Save
